

Betting Arbitrage Agent - Session Handoff

Generated: June 18, 2026

Branch: assessment-latency-profiling

Repo: <https://github.com/woozard/betting-arbitrage>

1. What This Project Is

Automated sports betting arbitrage system that:

1. Scrapes MLB moneyline odds from multiple offshore books
2. Compares cross-book prices to find arbitrage (combined implied probability < threshold)
3. Places matched bets on two books sequentially
4. Sends alerts to a private Telegram ops group

Production server: AWS EC2 ubuntu@100.53.194.189

App path: /home/ubuntu/betting-arbitrage

Systemd service: betting-arb (runs scheduler.py + jobs.yml)

2. What We Did In This Agent Session

Sports411 - fixed duplicate bets (critical)

Problem: SendBets API returned WagerResult: false even when bets were accepted (async post). Bot logged FAILED and retried every few seconds, placing many duplicate \$25 bets.

Fix:

- * Confirm via ``https://be.sports411.ag/en/open-bets/`` (NOT ``/pending`` - returns 404)
- * Match stake format: ``Risk:$10.00``
- * Poll open bets up to 45s after SendBets false
- * Single Place Bet click - no retry loops
- * Skip if bet already on open bets
- * ``MAX_WAGER_ATTEMPTS_PER_ARB = 1``

Production betting flow - sequential, \$20, private Telegram

- * \$20 stake per leg (``BET_STAKE=20``)
- * S411 first -> Betamapola waits for S411 leg confirmed in Redis
- * Paradise first -> Betamapola waits for Paradise leg (second active pair)
- * Alerts only to Kley Carlos Arbs (``TELEGRAM_CHAT_OPS``) - old dev groups unused
- * Per-leg + complete + partial exposure Telegram alerts

Active book pairs (only these two)

| Pair | First leg | Second leg |

|-----|-----|-----|

| ``sports411:betamapola`` | Sports411 | Betamapola |

| ``paradisewager:betamapola`` | ParadiseWager | Betamapola |

BetWar and other combos are disabled in jobs.yml.

ParadiseWager - verified & enabled

- * API path: ``AddBet`` -> ``SaveBet`` (with account password) -> ``confirmBet``
- * API ``Amount`` = to-win, not risk - code converts \$20 risk from American odds
- * Manual test: Yankees \$12 to-win -> \$18 risk / \$12 win at -150 [OK]

* Pair activated with sequential Paradise -> Betamapola flow

Telegram `/scan` command

- * `telegram\_ops\_bot.py` polls ops chat for `/scan`
- * Returns MLB moneyline table + arb % + ASCII visual for active pairs
- * Only responds in `TELEGRAM\_CHAT\_OPS`

Profit threshold

- * `MIN\_ARB\_PROFIT\_PCT=1.01` on server -> only auto-bets when profit $\geq 1.01\%$
- * Equivalent: total implied probability < 0.9899
- * (Briefly tested at 1.03 for near-arbs; reverted to strict, then set to 1.01% min profit)

Manual Baltimore test (S411 x Betamapola)

- * S411: Baltimore Orioles +125 @ \$20 [OK]
 - * Betamapola: Seattle Mariners -136 @ \$20 [OK] (required stopping scheduler - session conflict with `betamapola\_odds`)
-

3. Architecture

```
scheduler.py (jobs.yml every 30s)
??? arbitrage.py      -> scan DB odds, insert arbs, Telegram "Arbitrage"
??? sports411_odds.py -> scrape S411 -> DB
??? betamapola_odds.py -> scrape Betamapola -> DB
??? paradisewager_odds.py -> scrape Paradise -> DB
??? sports411_betting.py -> place S411 leg ($20)
??? paradisewager_betting.py -> place Paradise leg ($20)
??? betamapola_betting.py -> place Betamapola leg after first leg confirms
??? telegram_ops_bot.py -> /scan command (long-running)
```

Cache (Redis): arb opportunities, leg-placed flags, scan locks, alert dedup

Betting order:

```
Arb found -> First book places $20 -> mark leg in Redis
            -> Betamapola sees first leg -> places $20
            -> Both confirmed -> "Arbitrage Complete" Telegram
```

4. Current Server Configuration (.env)

```
| Variable | Purpose |
|-----|-----|
| `BET_STAKE=20` | $20 risk per leg |
| `SEQUENTIAL_ARB_BETTING=true` | Sequential legs + ops-only alerts |
| `MIN_ARB_PROFIT_PCT=1.01` | Min 1.01% profit to auto-bet |
| `ACTIVE_ARB_BOOK_PAIRS=sports411:betamapola,paradisewager:betamapola` | Allowed pairs only |
| `TELEGRAM_CHAT_OPS=-1003803751267` | Kley Carlos Arbs group |
| `TELEGRAM_BOT_TOKEN` | Existing bot (kleyman_arb_bot) |
```

Credentials live in server .env - copy from EC2, do not commit:

- * `BETAMAPOLA\_ACCOUNT` / `BETAMAPOLA\_PASSWORD`
 - * `PARADIESWAGER\_ACCOUNT` / `PARADIESWAGER\_PASSWORD`
 - * S411 account hardcoded in `sports411\_betting.py` (8715)
-

5. Telegram Alerts (Kley Carlos Arbs)

```
| Event | Message |
|-----|-----|
| Arb found | `===== Arbitrage =====` |
| Any leg confirmed | `===== Leg Confirmed (Real Money) =====` |
| Both legs done | `===== Arbitrage Complete =====` |
| One leg only | `===== Partial Arb (One Leg Only) =====` |
| Manual `/scan` | Full odds + arb % tables |
```

6. Key Files Changed

```
| File | Role |
|-----|-----|
| `controllers/Sports411Controller.py` | Open-bets confirm, single click, skip duplicates |
| `controllers/BetamapolaController.py` | Wait for first leg (S411 or Paradise) |
| `controllers/ParadiseWagerController.py` | Password on SaveBet, risk->win conversion |
| `controllers/ArbitrageController.py` | Pair filter, MIN_ARB_PROFIT threshold |
| `utils/bet_placement.py` | Ops Telegram: leg / complete / partial alerts |
| `utils/config.py` | BET_STAKE, pairs, MIN_ARB_PROFIT_PCT |
| `utils/arb_scan_report.py` | /scan report builder |
| `telegram_ops_bot.py` | /scan polling bot |
| `jobs.yml` | Active jobs only |
| `test_s411_place_bet.py` | Manual S411 E2E test |
| `test_betamapola_place_bet.py` | Manual Betamapola test |
| `test_paradisewager_place_bet.py` | Manual Paradise test |
```

7. EC2 Access

```
ssh -i "/path/to/pinn-arb-new.pem" ubuntu@100.53.194.189
cd /home/ubuntu/betting-arbitrage
```

Deploy from laptop:

```
rsync -avz --exclude '.git' --exclude 'venv' --exclude 'logs' \
-e 'ssh -i "PEM"' ./ ubuntu@100.53.194.189:/home/ubuntu/betting-arbitrage/
sudo systemctl restart betting-arb
```

Monitor:

```
sudo journalctl -u betting-arb -f
tail -f logs/sports411_betting.log logs/betamapola_betting.log logs/arbitrage.log
```

Maintenance:

```
./stop_for_maintenance.sh # stop
./start_after_maintenance.sh # start
```

8. Continue On Your Laptop

```
git clone https://github.com/woozard/betting-arbitrage.git
cd betting-arbitrage
git checkout assessment-latency-profiling
python3 -m venv venv && source venv/bin/activate
pip install -r requirements.txt
```

Copy .env from EC2:

```
scp -i PEM ubuntu@100.53.194.189:/home/ubuntu/betting-arbitrage/.env .
```

Recent commits (newest first):

- * `01cbe72` - /scan bot, MIN_ARB_PROFIT_PCT, Betamapola test
- * `c91edfa` - Paradise+Betamapola pair
- * `f7f204e` - S411 sequential + ops Telegram
- * `8bb3d98` - S411 open-bets fix (duplicate wagers)

Manual tests (on EC2 with xvfb):

```
xvfb-run -a venv/bin/python3 test_s411_place_bet.py --team-name "Team" --stake 20
xvfb-run -a venv/bin/python3 test_betamapola_place_bet.py --team-name "Team" --stake 20
xvfb-run -a venv/bin/python3 test_paradisewager_place_bet.py --team-name "Team" --stake 20
venv/bin/python3 show_arb_pairs.py # cross-book scan from DB
```

Telegram: Send /scan in Kley Carlos Arbs.

9. Why Arbs May Not Execute

Scanner requires profit $\geq 1.01\%$ (total prob < 0.9899). Typical MLB cross-book lines sit at 1.01-1.03 (negative edge) - no auto-bets is normal.

Use /scan to see live status. Closest pairs are often -1% to -2.6%.

10. Known Issues & Warnings

1. Duplicate open bets on S411 from pre-fix retries (~\$2k at risk) - cancel manually on book
 2. Betamapola session conflict: only one wager session per account - stop betting-arb before manual Betamapola tests
 3. ParadiseWager from Serbia: needs US VPN or EC2; bot uses BrightData proxy
 4. Paradise stake: API uses to-win amount; \$20 risk is converted in code
 5. S411 attach/xdotool experiments exist but are NOT used in production
-

11. Agent Context For Cursor

When resuming in a new agent/chat on your laptop:

"This is the betting-arbitrage repo on branch `assessment-latency-profiling`. Production runs on EC2 100.53.194.189. Active pairs: sports411xbetamapola and paradisewagerxbetamapola at \$20 sequential. S411 confirms via /en/open-bets/. Telegram ops chat: Kley Carlos Arbs. MIN_ARB_PROFIT_PCT=1.01. Read docs/BETTING_ARB_AGENT_HANDOFF.md."

End of handoff document
